Herman & Chomsky (1988) have developed a propaganda model to explain why some subjects are preferably dealt with by the news media whereas no attention is paid to others. An essential criterion for this is the usefulness of a topic. Herman & Chomsky, therefore, refer to "worthy" und "unworthy victims": victims of national or international violence, whose torments, though comparable from an objective point of view, are useful as a weapon against an actual enemy in one case, while they are useless, and hence devoid of interest, in another. If responsibility for violence lies in one's own sphere of influence, any reporting on its victims would be unfavorable to one's national interest.

According to Herman & Chomsky, reporting on worthy and unworthy victims differs with respect to the presentation and the support of reproaches towards the perpetrators as well as with respect to the featuring of their actions and their victims.

In order to test this conjecture, the present paper applies the Latent Class Analysis to a content analytical study of German newspaper reports on allied pilots shot down during the Gulf War. Taken prisoner by Iraq and presented publicly by Iraqi television, those pilots can be considered a typical example of worthy victims: the Western news media presented them as proof of torture and maltreatment of prisoners and used them as instruments for legitimizing allied war objectives beyond the liberation of Kuwait.

1. Chronology

On January 19, 1991, it was publicly announced that Iraq had captured allied pilots who had either crashed or been shot down. The first news articles about this event appeared on Monday, January 21, 1991.

The next day, the pilots could be found on the front page in almost all the newspapers. It was the day on which there were reports about the "parading" (Vorführung) of seven allied pilots on Iraqi television and about the Iraqi threat to use prisoners of war as "protective screens"; the first reactions from the allied forces, as well as the International Red Cross, were also topics.

On January 23, 1991, the first "doubts about the torture of prisoners" arose in a few newspapers; the Geneva Convention on the protection of prisoners of war was quoted and commented upon; the rescue of a pilot from Iraqi captivity, and the presentation of "further prisoners on Baghdad television" were reported.

In the following days came less and less news about the pilots. Iraq attempted to defend itself with counter-reproaches, and set conditions for the held prisoners. On January 26, 1991, the announcement finally came: "for the time being, no further Iraqi television pictures of prisoners of war", with which the topic diminished in importance in view of other events for the next weeks.

The beginning of March marked the return of the pilots and other prisoners of war back into the newspapers. They are the "core" of the "speedy armistice negotiations between the allied forces and Iraq". The first ten prisoners are released at once in a "goodwill gesture" and turned over to the Red Cross. They are "...in good health". Then on March 6, "...allegedly all prisoners of war (are) free" and "...apparently in good shape". Things for them had even
become "better in the past few weeks".

Between March 7 and 12, the pilots appear again only sporadically. From March 13 on, it is stated, however, that "...prisoners of war had been ill-treated" or "tortured with electric shock", while the Bildzeitung (referred to hereafter as the Bild) commented on the captivity of "beautiful Melissa", reporting that "the guards shared cigarettes with her".

2. Problem and method

The topic of the present paper is a study by Kempf & Reimann (1994), in which coverage on these events in German language newspapers was analysed.

The major nationwide daily newspapers were examined: Die Tageszeitung (taz), Frankfurter Rundschau (FR), Süddeutsche Zeitung (SZ), Frankfurter Allgemeine (FAZ) and Die Welt, all of which are considered to be "good quality newspapers with a high journalistic level... representing most of the political spectrum in the Federal Republic of Germany" (Staab, 1991). Aside from these, other newspapers were analysed: the Bild newspaper, by far the most widely circulated daily newspaper of the Federal Republic of Germany; as well as the Südkurier (SK) and the Stuttgarter Zeitung (StZ), two major regional newspapers of Baden-Württemberg; and the Neue Züricher Zeitung (NZZ), which has often been praised for its serious journalism.

Articles from these newspapers were analysed, monitoring the up-to-date press coverage on the Gulf War. Commentaries, leading articles, etc. were not taken into consideration. The same holds for articles in other sections of the newspapers, i.e. the culture and business sections.

The time periods of January 21-26 and March 4-20 were examined, although, however, no more thematically relevant articles were found after March 16.

The theoretical framework of this examination is represented by the propaganda model developed by Herman & Chomsky (1988), which should explain why certain themes were taken up by the media, while others went to the board and received no attention.

In the selection of international news, just as with national or local news, unusual items (i.e. catastrophes, riots, and coups d'état) are especially taken note of. The existence of regionalism, found in all systems of media, can be made responsible for the disparity of press coverage on somewhat comparable events: one's own particular region is given the most attention. The more important countries (i.e. world powers), as well as geographically or culturally close countries, are covered more closely by the media; and, likewise, economic, ideologic, and political alliance connections lead to a more intensive press coverage about another country (Kunczik, 1990).

In the case at issue, however, a further point of view must be examined in terms of the press coverage on the victims of the Gulf War: the point of view of usefulness of the topic which can be unfolded in the context of war propaganda.

Herman & Chomsky speak therefore of "worthy" and "unworthy victims": Victims of national or international violence, whose suffering is objectively comparable. In one case they are useful since they can be used as a weapon against the current enemy; and in the other case they are useless and uninteresting. Since the responsibility here lies in the respective jurisdiction, focusing on the victims does more harm than good to one's own interests.

According to Herman & Chomsky, press coverage on worthy victims differentiates itself from that on unworthy victims both with regard to the focusing on and substantiation of reproaches against the perpetrator, as well as with regard to the featuring of the actions and the victims.

In the case of worthy victims, the reproaches

- are delivered in a convincing style,
- which permits no criticism or alternative interpretations whatsoever,
- and makes efforts for corroboration from an authority figure.

The featuring of the actions and their victims
- make use of an aggravating choice of words,
- and search for the responsibility of the actions at the top;

### 3. Focusing on and substantiation of reproaches

In order to comprehend this style of focusing on and substantiation of reproaches, the text passages (paragraphs) to be analysed were examined to see whether they contain the style characteristics described in Table 1.

</tbody>
</table>
As Table 1 shows, the focus on reproaches against Iraq occurred in 217 of the 480 analysed paragraphs, while the focus on counter-reproaches against the allied forces could only be found in 57 paragraphs.

Taking into account that the analysed texts contain press coverage on allied prisoners of war, this result does not yet suffice to prove, however, that there is a dissimilar press coverage on worthy and unworthy victims.

Moreover, the analysed texts (paragraphs) come from various daily newspapers, representing a very wide political spectrum. Accordingly, it cannot be assumed that all of these texts adhere to the same press coverage style. Additionally, the press coverage style of a particular newspaper itself could have changed during the war and even different paragraphs within one and the same newspaper article could follow different styles.

The frequency distribution of the style characteristics in Table 1, therefore, is not capable of describing the very style of focusing on and substantiation of reproaches. Instead it may be a mixture distribution, resulting from the blending of various (latent) press coverage styles. In order to identify these styles, the mixture distribution must be unmixed, as can be done with the help of the method of Latent Class Analysis (Lazarsfeld 1950).

In the present paper, the calculations of Latent Class Analyses were made according to the algorithm from Goodman (1974) and were computed by use of the computer program LACORD by Rost (1988). Both, Akaike's (1987) Information Criterion (AIC-Index) and Bozdogan's Best Information Criterion (BIC-Index), served as goodness of fit criteria.

Table 2: Goodness of fit criteria for the Latent Class Analysis of the focusing on and substantiation of reproaches against both war parties.

Table 2 shows that, with regard to the focusing on and substantiation of reproaches against the war parties, five different styles of press coverage could be identified. Both, AIC and BIC, have their minimum value at h=5 latent classes.

Table 3: Latent styles of focusing on and substantiation of reproaches against both war parties. Focus = Focusing on theme; Fact. = Factual corroboration; Exp. = Expert corroboration.

The parameters of the identified latent styles are shown in Table 3.

1. The style characteristic for 41.1% of the analysed paragraphs, and therefore by far the most wide-spread style,
describes such text passages in which the reproaches are only touched upon in the fringes. Among them:

- reproaches against Iraq occur only seldom (5.5%); even less frequent are their factual (2.2%) and/or expert corroboration (1%) and/or also factual down-toning (1.3%);

- there are no reproaches whatsoever (0%) and/or expert corroboration (0%) against the allied forces.

2. With 38.0% of the analysed paragraphs, the image of Iraq as the enemy occurs as the second most frequent style of press coverage. It is characterized by:

\[ \textit{Seite 5} \]

- Reproaches against Iraq (94.4%), and frequently their expert corroboration (36.5%), hardly any factual corroboration (0.6%), but occasionally factual down-toning (10.9%).

- No reproaches (0%) and/or expert corroboration (0%) against the allied forces.

This style, to a large extent, corresponds with the propaganda style described by Herman & Chomsky of focusing on and substantiation of reproaches. However, the propaganda proves to be more differentiated and not completely without criticism on the reproaches. Occasionally it also provides counter-arguments. Obviously, these play a role in the anticipation of counter-arguments: By the use of so-called two-sided presentations attitude changes can be made more resistant against subsequent counter-propaganda (Lumsdaine & Janis, 1953).

3. In 9.2% of the analysed paragraphs there is a style which expresses a critical attitude towards the allied forces:

- These text passages contain without exception reproaches against the allied forces (100%), which frequently find corroboration from experts (43.9%), and occasionally in the facts (12.1%);

- occasionally, in this context, also reproaches against Iraq are focused upon (18.6%) and factually corroborated (21.3%). Reproaches against Iraq experience, however, no expert corroboration whatsoever (0%).

4. the defence of Iraq characterizes the style of 7.1% of the analysed text passages. This includes:

- without exception, the down-toning of reproaches against Iraq (100%), frequently with expert corroboration (52.1%);

- in addition, the reproaches against Iraq itself are also frequently made (27.2%), and arguments about their factual corroboration are cited (48.2%). For these, however, there are no efforts for expert corroboration (0%).

- Reproaches against the allied forces, in contrast, do not occur (0%).

5. Found in 4.7% of the analysed paragraphs, the least frequent style focuses on reproaches against both war parties, especially, though, against Iraq. This style is characterized by the frequent occurrence of all the examined style characteristics,

- whereby reproaches against Iraq (73.8%), their factual (65.8%) and expert corroboration (73.3%) occur relatively more frequently than

- reproaches against the allied forces (56.8%) and/or their corroboration in the facts (46.2%) and from experts (26.4%).

The focus on reproaches against both war parties can either be the result of the use of two-sided presentations as a vehicle for propaganda, as, for example, is often the case in the \textit{Welt}, where this style occurs relatively most frequently, with 8.34%; or it could also be the expression of critical distance against both war parties, as it can be found somewhat in the \textit{taz}, where this style occurs, at 6.64%, with a similar frequency as in the \textit{Welt} (cf. Table 4).
Table 4: The probability of occurrence for the identified styles in the analysed daily newspapers.

If one examined the probability of occurrence for the identified styles in the various daily newspapers (cf. Table 4), one could see a great difference in the types of press coverage.

Table 5: The probability of occurrence for the identified styles in the analysed time periods

While objective press coverage, in which reproaches are only touched upon in the fringes (Style 1), most frequently occurs in the NZZ (58.46%) and both of the regional newspapers StZ (57.26%) and SK (52.08%), it occurs least in the Welt (25.27%).

The most frequent style in the Welt (57.42%) is the image of Iraq as the enemy (Style 2), which is also typical for the press coverage of the Bild (54.72%). A significant difference between the press coverage of the Welt and the Bild can be seen, however, in that the Bild strictly avoids critical statements against the allied forces, so that not only the critical attitude does not occur at all towards the allied forces (expressed in Style 3) in the Bild (0%), but also in the Bild there are basically no two-sided presentations made use of as vehicles for propaganda (Style 5) (0.6%).

The image of Iraq as the enemy (Style 2) is found least frequently in the FAZ (27.59%), which also expresses most frequently a critical attitude towards the allied forces (Style 3) (19.7%).

Attempts at defending Iraq (Style 4) were most frequently made in the FR (17.03%). In the StZ (1.5%), the NZZ (1.6%) and in the taz (2.41%), they occur least frequently. The taz was also the only major nationwide daily newspaper that had taken a stance in clear opposition to Iraq already in the first Gulf war (Palmbach & Kempf, 1994).

In the Bild, critical statements against the allied forces were strictly avoided (0%); the focus on reproaches against both war parties nearly did not occur either (0.6%).

If one examines the probability of occurrence for the identified styles in the analysed time periods (cf. Table 4), it can be seen just how greatly the image of Iraq as the enemy (Style 2) had been characteristic for the press coverage in January (46.16%). In March, in contrast, the entire theme was clearly pushed into the background, and was focused upon only in the fringes in two-thirds of the analysed text passages (Style 1).

It is also worth noting that, in March, a critical attitude towards the allied forces (Style 3) could only be found in barely 4% of the analysed text passages. In January, it could be found three times as frequently. The same holds for reproaches against both war parties (Style 5), which in March could only be found in about 2% of the analysed texts.

The defence of Iraq (Style 4) at the time of the armistice negotiations, in contrast, was given twice as much space...
than had been the case in January (cf. Table 5).

4. Featuring of worthy and unworthy victims

In order to comprehend the style of featuring of worthy and unworthy victims as described by Herman & Chomsky, the text passages to be analysed were consequently examined to ascertain whether they contain the style characteristics listed in Table 6.

---

**Table 6: The frequency of the style characteristics for the featuring of worthy and unworthy victims.**

Table 6 shows that the various style characteristics found very different application: in spite of the combination of all the style characteristics of Iraqi victims into one single characteristic, this occurs with only 6.7% of the analysed paragraphs. This is grossly less than the frequency of any single style characteristic for the featuring of allied victims.

---

**Table 7: Goodness of fit criteria for the Latent Class Analysis of the featuring of worthy and unworthy victims.**

The results of the Latent Class Analysis show that, in the analysed text passages, three styles for the featuring of worthy and unworthy victims can be differentiated (cf. Table 7).
Table 8: Latent styles of featuring of worthy and unworthy victims. Aggr. = Aggravating Words; Resp. = Responsibility at the top; Human = Humanization; Dram. = Dramatic featuring; Every = Everyday world. Iraqi. Persp. = Attempt to see things also from the Iraqi point of view.

The parameters of the identified latent styles are shown in Table 8.

1. 71.4% of the analysed paragraphs contain a relatively unbiased press coverage: they portray, however, Iraq unequivocally in the role of the perpetrator:
   - "with just rage" [4] (28.2%), with the occasional humanization of allied victims (14.1%), the Iraqi responsibility was occasionally searched for at the top (6.9%), occasionally, though, also taking the Iraqi perspective (8.7%);
   - dramatic featuring of the stories (0.1%) and the inclusion of elements from the everyday world of the allied forces (0.0%), however, are basically never deployed, that is never as a style means.

2. Following on the second place, with 17.8% of the analysed text passages, is a propaganda style which does not occur, in this form, in the model by Herman & Chomsky, and which can be described as a propaganda construction of human interest stories:
   - Humanization (96.0%) and usually also dramatic featuring (80.4%) of the allied protagonists with frequent inclusions of elements from their everyday world (38.0%), and with occasional use of aggravating words (25%), remain in the foreground of the represented reporting.
   - On the other hand, it is hardly the case, however, that the responsibility is searched for at the top (1.2%). The stories speak for themselves.
   - In this respect, as Iraqi protagonists also appear in human interest stories, there minimally appears a focusing on the Iraqi perspective (i.e. the humanization of Iraqis) also (2.7%).

3. On the third place only (10.8% of the analysed paragraphs) follows the propaganda style described by Herman & Chomsky:
   - Usually through the use of aggravating words (88.5%), the responsibility is usually searched for at the top (78.1%). Allied victims are frequently humanized (43.8%) and dramatically featured (40.5%). There is also often an inclusion of elements from the everyday world of the Allies (28.1%).
   - The Iraqi perspective, in contrast, is never taken up (0%).

A significant difference between this propaganda style and the propaganda construction of human interest stories lies in the fact that the reader is presented here with a completed judgement: concerning the atrocity of the action, as well as concerning the responsibility at the top.

This is missing from the human interest stories stories. In these, the readers must (apparently) form their own judgement, even when this is already given by the characteristic style of the story, and cannot be interpreted in any other way than is intended by the propaganda. Through this, however, the reader might get the impression that he/she had formed his/her own judgements, based on individual experience. Because of this, a judgement might come about

that seems particularly credible and thus becomes especially immune to counter-propaganda as well as to attempts at emancipating enlightenment.

</tbody>
</table>
In terms of the analysed time periods (cf. Table 9), it turned out that the propaganda style described by Herman & Chomsky, at the time of armistice agreements in March 1991, was employed considerably less frequently for the featuring of press coverage on allied prisoners of war (4.78%) than was the case at the beginning of the war, in January (13.52%).

The use of human interest stories as a vehicle for propaganda is, in contrast, just as frequent in both time periods (17.6% and 18.21% respectively). In March, however, it is used no longer so much for the intensification of the image of Iraq as the enemy, but more for the rehabilitation of the allied prisoners of war, who had subsequently been made into heroes. During this time appeared such stories as the one about "beautiful Melissa", with whom the guards had shared their cigarettes, and the one about Jeffrey Zaun, who had smashed in his own nose to fake torture.

In sum, it can be said that nearly one-third of all the analysed text passages (28.6%) contain a propaganda featuring of worthy victims. For these the propaganda style described by Herman & Chomsky does not represent the most usual case, however. Nearly twice as frequently there is a propaganda style found that has not been described by Herman & Chomsky, and is based on the recounting of human interest stories.

The FR, the FAZ and the NZZ make only extremely seldom use of such vehicles for propaganda and, as a rule, report objectively; whereas in the Welt, objective press coverage can only be found in every other text passage (cf. Table 10).

Even more than in the Welt, in which half of all text passages are tainted with propaganda, the rules of objective press coverage are flagrantly broken by the Bild, in which propagandist tainting (82.2%), in fact, represents the normal case.

A significant difference between the two respective propaganda vehicles, the Welt and the Bild, lies in their preference of the two propaganda styles. While both styles occur in the Welt almost as frequently, the Bild chiefly makes use of the recounting of human interest stories.

A relative preference for human interest stories can also be seen in the SK, SZ, and taz. Only the FAZ largely forewent this form of muck-raking propaganda.

5. The interaction of focusing on reproaches and featuring of victims

Finally, it should be examined how the various styles of focusing on reproaches, on the one hand, and the featuring of victims, on the other, are combined with each other.

For this purpose, Kempf & Reimann (1994) calculated a so-called Latent Class Analysis of second order, into which the above identified styles were entered as fundamental variables. Since - with only two variables analysed - the results of the analysis might not be unequivocally identifiable, however, the present paper makes use of a slightly different approach and includes the source of the analysed text passages as an additional covariant in the analysis.
Table 11: Goodness of fit criteria for the Latent Class Analysis of second order.

Tables 11 and 12 show that the Latent Class Analysis of second order led to the identification of two latent styles, which are in good accordance with the results originally reported by Reimann & Kempf.

The parameters of the identified latent styles are shown in Table 12.

1. The style which is typical for 62.2% of the analysed text passages, and therefore the most frequently used style, is characteristic in relatively unbiased press coverage:
   - it touches upon the topic of the ascertained reproaches against Iraq only in the fringes (48.1%). Occasionally it makes use of the image of Iraq as the enemy (23.8%). Still it does not exclude a critical attitude towards the allied forces (15.7%);
   - only seldom (but twice as often as Style 2) is Iraq defended (9.1%), and (just as seldom as Style 2) reproaches are ascertained against both war parties (3.3%);
   - concerning the featuring of worthy and unworthy victims it is limited to relatively unbiased press coverage (99%);
   - human interest stories are never recounted (0%) and the propaganda style described by Herman & Chomsky is also practically non-existent (1%).

2. With 37.8%, there is a propaganda function in more than one-third of the analysed text passages:
   - reproaches are usually ascertained under the image of Iraq as the enemy (67.7%). Sometimes the topic is dealt with only in the fringes (24.5%);
   - reproaches against both war parties (3.4%) or the defence of Iraq (4.3%) hardly occur; a critical attitude towards the allied forces is never taken up at all (0%);
   - more than two-thirds of the text passages make use of the propaganda style described by Herman & Chomsky (27.0%) and/or the vehicle of propaganda in the form of human interest stories (42.4%).
Table 13: The probability of occurrence for the identified styles in the analysed time periods.

Concerning the examined time periods (cf. Table 13), it is shown that the propagandist functioning of the press coverage occurs in the armistice month of March less frequently than immediately after the beginning of the war, in January 1991.

Table 14: The probability of occurrence for the identified styles in the analysed daily newspapers.

The probabilities of the styles' occurrence in the various daily newspapers (cf. Table 14), which were entered as covariants into the Latent Class Analysis, reconfirm the role of the *Welt* and *Bild* newspapers as vehicles for propaganda even more dramatically than the original analysis. Additionally, they also reveal a considerably strong propaganda bias in the *Süddeutsche Zeitung* (*SZ*).

While the propaganda function of press coverage (Style 2) in all of the other newspapers amounts to between 14.11% (*FAZ*) and 32.17% (*taz*) of the examined text passages, it is characteristic for 41.85% of the text passages in the *Süddeutsche Zeitung* and for almost three quarters of the text passages in the *Welt* (74.34%). The most dramatic propaganda bias is shown in *Bild*, in which the propaganda style occurs in 100% of the analysed text passages.

6. Conclusion

In conclusion, it can be said that the propaganda model from Herman & Chomsky could be partially confirmed both with regard to the focus on and substantiation of reproaches against Iraq, as well as with regard to the featuring of the allied victims.

In contrast to the propaganda styles described by Herman & Chomsky, however, it was shown that the focus on and substantiation of reproaches against Iraq were also reinforced by two-sided presentations. Counter-arguments and alternative interpretations are not as strictly avoided as forecast by Herman & Chomsky. Instead there is also criticism on the reproaches. This is focused upon in order to make the achieved attitude changes immune to counter-propaganda.

Concerning the featuring of allied victims, in addition to the propaganda style described by Herman & Chomsky, the propaganda construction of human interest stories was proven. The latter, which is especially characteristic of the propaganda style of the *Bild* newspaper, occurs altogether even a little more frequently than the style described by Herman & Chomsky.

With regard to the application frequency of the different styles, the *Welt* and *Bild* newspapers could be identified, as it were, as prototypes of propaganda media, making a very clear distinction from most the other daily newspapers with exception of the *Süddeutsche Zeitung*, which also shows a considerably strong propaganda bias.

Footnotes:

[2] The analysed daily newspapers contained a total of 146 thematically relevant articles with 911 paragraphs (including headlines and titles, which were handled as paragraphs). Among them, 480 paragraphs (52.69%) were thematically relevant. These served as coding units for the content analysis.

[3] Such paragraphs, for example, report factually about the Geneva Convention.

[4] That is, through the use of aggravating words. In view of the topic their complete avoidance would have required particular efforts. They were not used so frequently, however, that one would suppose that there is a hidden agenda with a particular aim in mind.

[5] Since no maximum of the likelihood could be found for three or higher latent classes, only goodness of fit statistics for the one- and two-class solutions are presented in Table 11.

[6] In contrast to the results by Kempf & Reimann (1994), the definition of a relatively unbiased press coverage (Style 1) now includes the complete absence of human interest stories, however (0% instead of 11.8% in the original analysis) and, therefore, is found less frequently in the data (62.2% instead of 72.7%). Accordingly, the propaganda function (Style 2) is shown more dramatically by the present analysis: it is identified more often (37.8%) than in the original analysis (27.3%) and emphasizes the use of human interest stories more strongly (43.4% instead of 27.3%) while the image of Iraq as the enemy plays a minor role (67.7% instead of 85.9%) and the propaganda style more often touches upon the reproaches only in the fringes (24.5% instead of 8%).
